Catalog: My Bible Study Web App

Michael Jeszenka

mjeszenka3@gatech.edu

run.sh

This is found in the root directory. Run this script in Linux to launch firefox and navigate to the web app. It may be run with the following command:

```
./run.sh
```

If you are not in Linux then you can instead simply open up your favorite web browsers and navigate to: http://mybiblestudywebapp.us-east-2.elasticbeanstalk.com/index.html

root directory

Many of the files in the root directory are related to build the project, docker, and pushing it to my AWS repository. They will not work in your environment. To do so would require my AWS credentials. I apologize for the inconvenience.

.mvn/wrapper/

This is a standalone executable version of maven, the build tool I used.

documentation/

This folder contains schema diagrams of the database I made, as well as a UML sequence diagram showing how the service classes inside the backend app communicate with each other.

frontend/

This contains the frontend html and javascript files. It is used for testing purposes locally and is not included in the actual deployed version of the app. It mirrors the html and javascript files found in src/main/resources/static

sql/

This folder contains scripts for setting up the Postgres database.

src/

This folder contains all the source code of the project.
